

Medical Scenario: On the day of discharge, Dr. Burke (Discharging Physician) establishes an audio communication with Dr. Monteiro (Senior Clinician) to discuss the discharge of patient Baby Jane. During the conversation, Dr. Burke composes a discharge package, DisPkg_1, referred to as a *form*, and sends it to Dr. Monteiro to be validated. The DisPkg_1 form consists of “RecSum-Jane.txt” (text file), summary of patient's condition; x-Ray of the patient's heart, “xRay-Jane.jpg” (non-stream file); and “HeartEcho-Jane.mpg” (video clip), an echocardiogram (echo) of the patient's heart.

The following diagrams show the instances executed by the CVM during realization. Although the instances are represented using X-CML in the CVM we show them using G_CML.

Control instance for the medical scenario.

Data instance to enable live audio.

Data instance to send patient form.
